

Vega Field Clever Vending

At-a-Glance

Vega Field is an extension of Vega VMS which allows the management and the supervision of the external staff and the interaction with all the SMART technologies installed on V.M. in real time. Usable with any internet browser or installed locally, Vega Field allows to consult the V.M., to look over the stock in real-time, to supervise the external activities, to monitor the progress of the route and to manage the alerts communicating with the merchandisers and technicians.

Who is it dedicated to:

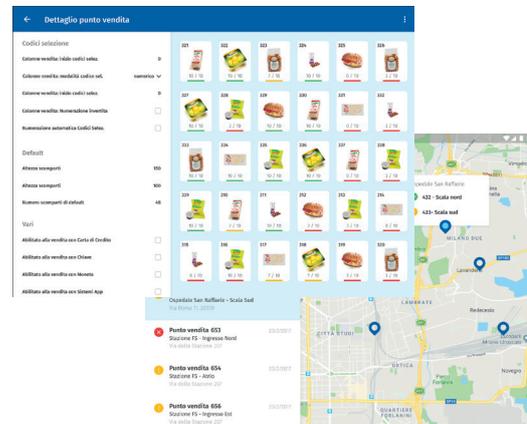

- To final users integrating digital wallets and profilations
- To merchandisers for the coordination of their activities and the Predictive picking
- To the team leaders to manage their team everywhere
- To the controllers to orchestrate external activities on a base of a vision of the V.M. park in real time
- To the area or branch leaders to have performance KPI and markers in real time

“A complete suite of all essential tools for Vending. For over than 12 years the partner which guides the growth of my company, moving up its needs”.

Roberto Pace A.D. Gedac vending

The main tools to transform the "Smart" vending into the "Clever" vending": Vega Field

The establishment of smart technologies and connectivities typical of IOT (Internet of Things) leads to a few questions:

How to use these new sources of info and interaction? • How to balance these innovative tools with the traditional business processes? • How to integrate the data in real time with the already managed info? • How to transform the new info in economic savings and improvements of performances? • And in the end how to manage the transient or the downgraded modality in absence of connectivity?

How Vega Field can help you:

The picking on the van takes place consulting the V.M. before reaching the PoS. No pre-refill is needed: **a reduction of 5 minutes per visit** for the V.M. equipped with the necessary technology

The V.M. stock displayed in real time with different layouts, allowing to intervene according to the business model of the company

The dashboards for auditor, area leader, controller and branch leader allow to **interact and monitor** the resources on the field at different levels of detail and with different **KPI**.

The **alerts** and the info on the executed activities give prompt **decision-making tools** to act and correct the errors otherwise barely manageable.

Coherence in the load and respect of the planning, divergence of the collection, average times for the tasks management, daily advancement, change-giver levels decrease and telemetry alerts are only a part of the data available

And all these are integrated natively with Vega VMS and Vega Optima.

Integrating APPs, smart payments, digital wallets and allowing refunds and promotions to the single users directly from Vega VMS.

Requirements:

On V.M.: telemetry system able to send single sales

Merch.: Android PDA or windows mobile with data connectivity

Back office: tablet or browser to display the dashboard

Controllers room: Monitor manager and dedicated hardware
